16. Abstract <p>In three of the previous four reports in this series, I examined the changes from 1984 to 2011 in the number of registered light-duty vehicles, and the corresponding changes in distance driven and fuel consumed. The units of the analyses were both the absolute numbers and the rates per person, per driver, per household, and (where appropriate) per vehicle. The main finding of those three reports is that the respective rates all reached their maxima around 2004. I argued that, because the onsets of the reductions in these rates preceded the onset of the recession (in 2008), the reductions in these rates likely reflect fundamental, noneconomic changes in society. Therefore, these maxima have a reasonable chance of being long-term peaks as well. The present report provides a brief update on these measures through 2012.</p> <p>The main findings of this study are as follows:</p> <p>(1) Despite the population growth, the absolute amount of fuel consumed by light-duty vehicles decreased by 11% during the period 2004 (the year of maximum consumption) through 2012.</p> <p>(2) The reductions in the rates per person, per driver, per household, and (where appropriate) per vehicle from the corresponding maxima (around 2004) to 2012 were greatest for fuel consumed (averaging about 16%), followed by distance driven (about 8%) and number of vehicles (about 6%). (The fact that the reductions were greatest for fuel consumed reflects, in part, the added contribution of the improvements in vehicle fuel economy.)</p> <p>(3) The 2012 rates of vehicles and distance driven were comparable to the rates during the early- to mid-1990s. The 2012 rates of fuel consumption were lower than the rates in 1984—the first year of this analysis.</p> <p>(4) There is no evidence in the examined data that the recent reductions in the rates were temporary. Indeed, out of the 11 rates examined, 6 showed a decrease from 2011 to 2012, 3 showed no change, and 2 showed an increase.</p>

## Introduction

In the first three parts in this series of reports, I examined the changes from 1984 to 2011 in the number of registered light-duty vehicles (Sivak, 2013a), and the corresponding changes in distance driven (Sivak, 2013b) and fuel consumed (Sivak, 2013c).<sup>1</sup> The units of the analyses were both the absolute numbers and the rates per person, per driver, per household, and (where appropriate) per vehicle. The main finding of those three reports is that the respective rates all reached their maxima around 2004. I argued that, because the onsets of the reductions in these rates preceded the onset of the recession (in 2008), the reductions in these rates likely reflect fundamental, noneconomic changes in society (such as increased telecommuting, increased use of public transportation, increased urbanization of the population, and changes in the age composition of drivers). Therefore, these maxima have a reasonable chance of being long-term peaks as well. The present report provides a brief update on these measures through 2012.

---

<sup>1</sup> The fourth part in the series examined the changes in households without a light-duty vehicle from 2005 to 2012 (Sivak, 2014).

## **Method**

The number of light-duty vehicles (cars, pickup trucks, SUVs, and vans) was obtained or calculated from the information in FHWA (2014). For 1984 through 2006, this number was the sum of cars and other 2-axle, 4-tire vehicles. For 2007 through 2012, this number was the sum of short-wheel-base and long-wheel-base light-duty vehicles.

The sources of other relevant data were as follows:

- distances driven by light-duty vehicles: FHWA (2014)
- fuel consumed by light-duty vehicles: FHWA (2014)
- resident population: ProQuest (2013)
- licensed drivers: FHWA (2014)
- households: U.S. Census Bureau (2013)

Some of the underlying data were recently revised for 2010 and 2011, and this analysis incorporates those revisions.

## **Results**

### **Absolute numbers of vehicles, distances driven, and fuel consumed**

Table 1 presents the numbers of registered light-duty vehicles, distances driven, and fuel consumed from 1984 to 2012. These data are also presented in Figure 1.

Table 1  
Registered light-duty vehicles, and the corresponding distances driven  
and fuel consumed, 1984-2012. (The maxima are in **bold**.)

Year	Vehicles (thousands)	Miles driven (millions)	Gallons consumed (millions)
1984	156,751	1,559,227	94,425
1985	165,730	1,633,637	98,290
1986	170,251	1,690,261	101,481
1987	173,049	1,770,779	102,838

Figure 4. Amount of fuel consumed per person, per licensed driver, per household, and per registered vehicle, 1984-2012.

The main aspects of the data in Tables 3 through 5 (and Figures 2 through 4) are summarized in Table 6.

Table 6  
The main aspects of the rates in Tables 3 through 5 (and Figures 2 through 4).

Measure	Maximum year(s)	Latest year prior to the maximum year(s) that had a rate lower than the 2012 rate	Change from the maximum to 2012	Change from 2011 to 2012
Vehicles				
per person	2006	1997	-6.3%	-1.3%
per driver	2001, 2005, 2006	1997	-5.2%	0.0%
per household	2001, 2005, 2006	1992	-5.9%	-1.0%
Distance driven				
per person	2004	1996	-8.9%	-0.2%
per driver	2004	1994	-8.3%	+0.6%
per household	2004	1993	-9.6%	-0.4%
per vehicle	2004	1994	-4.6%	+0.6%
Fuel consumed				
per person	2004	pre 1984	-16.9%	-0.8%
per driver	2004	pre 1984	-16.4%	0.0%
per household	2004	pre 1984	-17.6%	-1.0%
per vehicle	2003	pre 1984	-13.5%	0.0%

## Conclusions

### **Trends in the absolute numbers**

The trends in the absolute numbers of light-duty vehicles, distances driven, and fuel consumed were of less interest in this study than the corresponding rates. This was the case because the changes in these absolute numbers reflect, in part, the ever-growing population. However, despite the population growth, fuel consumed by light-duty vehicles decreased by 11% during the period from 2004 (the year of maximum consumption) through 2012 (see Table 2).

### **Trends in the rates per person, per driver, per household, and per vehicle**

*Maximum years.* As is evident from Table 6, the rates tended to reach their maxima around 2004.

*2012 rates in the context of the rates from 1984 through 2012.* The 2012 rates of vehicles and distance driven were comparable to the rates during the early- to mid-1990s (see Table 6). The 2012 rates of fuel consumption were lower than the rates in 1984—the first year of this analysis.

*Changes from the maximum years to 2012.* The reductions in the rates from the corresponding maxima (see Table 6) to 2012 were greatest for fuel consumed (averaging about 16%), followed by distance driven (about 8%) and number of vehicles (about 6%). The fact that the reductions were greatest for fuel consumed reflects, in part, the added contribution of the improvements in vehicle fuel economy (Sivak and Schoettle, 2014).

*Changes from 2011 to 2012.* There is no evidence in the examined data that the recent reductions in the rates were temporary. Indeed, out of the 11 rates examined (see Table 6), 6 showed a decrease from 2011 to 2012, 3 showed no change, and 2 showed an increase.
